AB - PURPOSE:To make it possible to transmit data of telephone numbers, address books, etc., mutually between a portable radio telephone system and fixed telephone system and to record the data by providing a signal conversion part performing a mutual conversion between the data of a data storage part and an input signal to a radio part.

- CONSTITUTION:When data of telephone number, address books, etc., is made to be stored in a fixed telephone system from a portable radio telephone system a call is made to the fixed telephone system and the data is inputted from an operation part 4 after the off-hook of the telephone system is detected. The data is converted into an input signal to a radio part 1 of a signal conversion part 10 and is transmitted by the radio part 1. The fixed telephone system converts the signal transmitted from the portable radio telephone system from a telephone line network interface part 11 via a basic station into data and the data is stored in a data storage part 9. When the data of telephone numbers, address books, etc., stored by the fixed telephone system is utilized, the data stored in the data storage part 9 is obtained from the telephone line network interface part 11 via the basic station and is made to be stored in the self data storage part 9.
